Paper Waste Disposal

The missing link
in company
security system

corporate espionage

controlled access system

server's protection

Millions of dollars are spent by some companies in the installation of security cameras and implementation of controlled access in order to beef up security to protect their premises. Firewalls are built to prevent hackers from breaking into the company's servers and stealing the most important data. Antivirus programmes are also installed to keep the company's data safe from viruses, worms or Trojans that keep springing up everyday. All these measures are taken to ensure that none of the company's important data is leaked out.

However, there is one thing that most companies forget to secure. That is their hard copies or paper waste, that is accumulated throughout the day whether as a result of printing, faxing or reproduction via the photocopy machine. Often, these papers are used to draft documents that contain confidential and very important information.

In order to cut cost in some budget-conscious companies, these waste papers are recycled and used for other purposes. If these papers aren't disposed of properly, they can easily end up in the wrong hands for the wrong reasons, and this can cause the company more money in the long run rather than translate into savings.

To prevent classified papers from being accessible to outside parties, these documents are shredded to pieces. However, again, after shredding, the shredded papers are left until they are ready to be disposed of. With today's technology, the shredded papers can be easily rearranged like a jigsaw puzzle. This method is becoming more and more common and even more readily available through the internet. The bottom line is, shredding the paper alone is not enough to protect your data in today's ever-changing world.

Puzer Protect

Vacuum System for Shredding
conveniently & securely
dispose of your paper waste

Puzer Protect Vacuum System for Shredding offers you the most comprehensive, secure and clean solution to the disposal of all your documents. The system works with vacuum technology that will suck up the shredded papers after they've been shredded into tiny pieces. Next, the papers will go through the pipes at high speed, due to the strong suction power of the vacuum system. The paper shreds will then be mixed up together to be later compacted into pulp. This method also saves space, because all the paper shreds are stored in a central station within the building and compacted. Thus office space can be maximised. The more important thing is that it is then virtually impossible to extract any data from it or trace the source of the waste.

This system is also very efficient, thanks to the vacuum technology. Shredding becomes a breeze and takes up little time. All you need to do is feed the paper into the machine, and see how fast Puzer Protect shreds and sucks the paper waste within seconds. For bulk documents, there are bigger shredders where bulky files can be dropped and shredded, thus feeding individual pages is unnecessary. In this way, you will have more time to conduct business rather than waste time shredding papers.

This method also keeps the office air fresh, as the strong suction power in the pipe lines ensures that the harmful paper dust do not circulate in the office. It also saves space because bags or other collection bins for temporary storage are not seen within the office premises.

Puzer Protect

Innovative solution for total data protection

In corporate world, security must be addressed as a whole rather than in compartments. That's why no matter how much effort spent to protect soft copy data, if the hard copy's not being destroyed accordingly then all the attempts will go down the drain. This happened because hard copy disposal is the missing link and also the weakest link in a company's security system. It's a missing link, because often companies overlooked the importance of protecting their hard copy data as comprehensive as the soft copy. It is also the weakest link, because it's the most accessible form to other people. With technology changes rapidly and along with these changes come new ways to store information. Thus, security cannot be a hindrance to technology advancements.

Puzer's Multimedia Shredder ensures that the entire security infrastructure remains protected. Designed to destroy a series of storage media with an eye to protect the environment, it offers segregation of waste type. The respective disposal slots are designed to match the particular characteristics of one form of storage media and material. Puzer Protect gives you innovative solution for total corporate data protection that will ensure that your hard copy gets the same protection level as the soft copy.

Complete your corporate security system

clean working environment

gain confidence from others

Next time you throw away a piece of paper or storage media from your table, think again. It could contain information which is so valuable to others that customised data mining strategy is deployed to collect.

Survey shows that information retrieved from the trash bins included detailed scaled maps of buildings, photocopies of passport, person's identity, medical records, names, mobile numbers, bank account statements, draft of company reports, research details, etc. Innocent information in your opinion might be worth millions to others. With Puzer Protect, your clients or business partners' confidence in your company is enhanced, knowing that there is no missing link in your office security system.

Don't take security as an afterthought. Security breach is expensive, put in the missing link in your security system - Puzer Protect System.

Paper Work

part of corporate communication

The accumulation of paper waste is inevitable in running an office. Paper waste is usually accumulated throughout the day from printing, duplicating or faxing, etc. Often, this paper waste contains confidential and valuable data that if not disposed of properly can fall into the wrong hands. Some companies use the conventional shredding method to get rid of such waste, but this is time consuming. Thus, some companies organise their documents into different categories and only those that are classified are shredded. Often, this classification is inappropriate and critical information is leaked out.

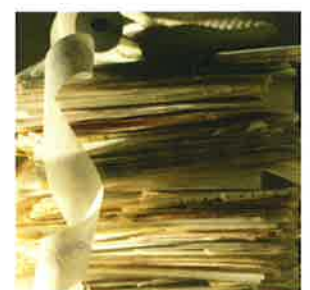

Puzer understands the need for a safe and efficient way to dispose of corporate refuse. With Puzer Protect, you can be confident that all your information will be disposed of safely, with high user rate due to its user-friendly attributes.
